Python Module	Copilot Variable String	Alan double check Variable String	Code Section
page_components.py	self.design.number_of_components	Correct	def _on_value_changed(self, value: int): """Updates the DesignModel immediately as the user interacts with the spin box.""" self.design.number_of_components = value self.design.number_of_components = value

	self.design.number_of_starting_mixtures	Correct	# Store number of starting mixtures
			if self.radio_single.isChecked():
			self.design.number_of_starting_mixtures = 1
			else:
			self.design.number_of_starting_mixtures = self.spin_starting.value()

page_solvent_picker.py	self.model.selected_solvents	Check this. I think it's diffferent, see code section -->	name_item = self.table.item(row, 3) if name_item: self.selected.append(normalize(name_item.text()))

	self.model.selected_solvents_pca	Check this, I think it is stored in here: self.design.selected_solvents_pca = list(set(self.selected)); see above/right code section	# Update the model with a unique list of selected solvents
			self.design.selected_solvents_pca = list(set(self.selected))

	self.model.selected_solvents	See above - connected issue to above/right code. Also on my debug, it seems a little prone to dropping one solvent from the pick list in "NoOfSolvent" . Seems glitch around methanol/isopropanol. If I click one at a time and move forward it is ok. To be checked later - let's not forget	return True

	NoOfSolvents = len(self.model.selected_solvents	Have updated code which gets the total solvents from page_solvent_pickler.py	# Update the model with a unique list of selected solvents
			unique_solvents = list(set(self.selected))
			self.design.selected_solvents_pca = unique_solvents
			no_of_solvents: int = len(unique_solvents)
			print(f"DEBUG: Number of unique solvents selected: {no_of_solvents}")

page_salt_formers.py	self.design.salt_formers	I think it should be self.design.salt_former_data	# 1. Load salt former data from the model data = self.design.salt_former_data acids = data["acids"] chiral_acids = data["chiral_acids"] bases = data["bases"] chiral_bases = data["chiral_bases"]
	self.design.include_salt_free_set	This looks ok	if not hasattr(self.design, "include_salt_free_set"): self.design.include_salt_free_set = False

	self.design.selected_salt_formers	This looks ok	# 2. Ensure model has fields
			if not hasattr(self.design, "selected_salt_formers"):
			self.design.selected_salt_formers = {
			"acids": [],
			"chiral_acids": [],
			"bases": [],
			"chiral_bases": [],

	NoOfSaltFormers	I have added a total, see code section	def validatePage(self) -> bool:
			acids = [cb.text() for cb in self.acid_checkboxes if cb.isChecked()]
			chiral_acids = [cb.text() for cb in self.chiral_acid_checkboxes if cb.isChecked()]
			bases = [cb.text() for cb in self.base_checkboxes if cb.isChecked()]
			chiral_bases = [cb.text() for cb in self.chiral_base_checkboxes if cb.isChecked()]
			
			self.design.selected_salt_formers = {
			"acids": acids,
			"chiral_acids": chiral_acids,
			"bases": bases,
			"chiral_bases": chiral_bases,
			}

page_solvent_volume.py	self.spin_volumes.value()	This looks ok	# Calculate total number of salt formers selected
			unique_salt_formers = list(set(acids + chiral_acids + bases + chiral_bases))
			self.design.no_of_salt_formers = len(unique_salt_formers)
			print(f"DEBUG: Number of unique salt formers selected: {self.design.no_of_salt_formers}")
			
			self.design.include_salt_free_set = bool(self.salt_free_checkbox.isVisible()
			and self.salt_free_checkbox.isChecked())
			
			# Page is always valid; user may select none and move on

	self.spin_replicate_pct.value()	See code section	def update_replicate_default():
			if not self.chk_replicates.isChecked():
			return
			
			n = self.spin_volumes.value()

	self.design.replicate_percentage	Check this, Copilot said self.design.replicate_percentage = self.spin_replicate_pct.value() / 100.0 --> done	def update_replicate_default():
			if not self.chk_replicates.isChecked():
			return
			
			n = self.spin_volumes.value()
			
			if n == 1:
			default_pct = 35
			elif n == 2:
			default_pct = 25
			elif n == 3:
			default_pct = 15
			else:
			default_pct = 5
			
			self.spin_replicate_pct.setValue(default_pct)
			
			# Connect heuristic to volume-level changes
			self.spin_volumes.valueChanged.connect(update_replicate_default)
			
			# Also expose heuristic as a method for checkbox toggling
			self.apply_replicate_heuristic = update_replicate_default
			def validatePage(self):
			self.model.replicate_percentage = self.spin_replicate_pct.value() / 100.0
			print(f"DEBUG: Replicate percentage set to: {self.model.replicate_percentage}")
			return True

page_plate_picker.py	self.model.plate_rows	This looks ok	
	self.model.plate_cols	This looks ok	

	self.model.randomize_design	This looks ok	self.model.plate_rows = rows
			self.model.plate_cols = cols
			self.model.free_format = free
			self.model.randomize_design = self.chk_randomize.isChecked()
			self.model.fill_to_full_plates = self.checkbox_fill_full.isChecked()
			# Calculate and print count for debugging
			unique_solvents = list(self.selected | self.preselected)
			print(f"DEBUG: Number of unique solvents selected in PCA: {len(unique_solvents)}")

	self.model.fill_to_full_plates	This is in place:- self.model.fill_to_full_plates = self.checkbox_fill_full.isChecked()	
page_pca.py	self.model.selected_solvents_pca	Have updated code which gets the total solvents from page_pca.py	

page_summary.py			from PyQt6.QtWidgets import QLabel, QVBoxLayout, QWizardPage
			
			class PageSummary(QWizardPage):
			def __init__(self, design_model):
			super().__init__()
			self.design = design_model
			
			self.setTitle("Summary (placeholder)")
			layout = QVBoxLayout()
			layout.addWidget(QLabel("Summary not implemented yet."))
			self.setLayout(layout)
			
			def validatePage(self):
			return True

	self.design.notes	page_summary.py is essentialy empty at the moment -->	
	self.design.user_experiment_code
